

## File Organization

The file organization chart found below includes the file name for each file available through the MET Longitudinal Database (LDB), along with the name and number for the ICPSR study in which each file can be found. It also lists the primary IDs included in each file to aid users in merging files or linking data within or across studies. Each file is provided in SPSS, SAS, STATA, R and ASCII formats. The ASCII version of each file name is used in the File Name column of the chart (da34771-0001.txt); other formats will follow the same naming conventions but will have different file extensions (da34771-0001.sav, da34771-0001.rda, etc.)

## Merging Data Files

The MET LDB includes six primary IDs that can be used to merge data files; **district, school, section, teacher, student, and video**. Most files include several IDs, and a MET respondent (teacher or student) or video may appear more than once in any particular file based on the level of analysis. For example, a teacher who taught three sections of math may appear three times in a file provided at the class/section level. Files at different levels of analysis can be merged. Users wishing to avoid creating files with redundant variables that contain excessive missing values or files with repeated cases with redundant information will need to aggregate variables up to, or disaggregate variables down to, a common analysis level, prior to merging. For more information on the analysis level of each file, see the MET LDB Study Organization charts.

Any data files containing the same ID can be merged. Two data files have been created to assist users wishing to merge files that do not share a common ID. The Subject ID Crosswalk contains only ID variables and describes the associations between districts, schools, teachers, sections and students. The Video Information File provides the relationships between videos and the district, school, teacher and section from which they were recorded.

More information about merging files, including counts of the number of teachers common across different combinations of files, can be found in Appendix A of the User Guide.

Study	File Name	Video ID	District ID	IDs Present in File
